BSIT 3A

REFLECTION PAPER

Building my own website turned out to be way harder than I thought. At first, I figured it would be simple, but once I started, I quickly realized how much there was to learn. Adding things like navigation bars, photo galleries, and different sections wasn't just about dragging them onto the page—it actually required a lot of coding . The real struggle, though, came when I tried to make the website responsive. I had so many moments where I felt stuck, trying to make sure everything looked right on both desktop and mobile. It took a lot of trial and error, and honestly, there were times I thought I wasn't going to get it right. But eventually, I figured it out, and it was such a relief to see it working on every screen.

The whole process definitely tested my patience. There was a lot of trial and error, and I had to go back and fix a ton of little mistakes. It wasn't easy, but when I finally saw the finished website, it felt like it was all worth it—even though it's not perfect, it's definitely something I'm proud of.

I learned a lot from the experience, especially how important it is to take your time when building a website. It's definitely not something you can just finish in one go. It's all about breaking it down step-by-step. I started by sketching everything out on paper first, figuring out how I wanted the site to look before I even opened up my laptop. That sketch became my guide, helping me stay focused and organized throughout the process. Taking it slow, focusing on one task at a time, and managing my time better made all the difference in getting the website done.
